

A word about our thrust bearings

These bearings are pre-lubed from the factory to perform perfectly in 24/7 run high speed equipment. For amateur use please read the following.

- 1. You will probably never ever need to lube them.**
- 2. If you do lube them in the future do not put so much grease in them that the grease flows out of the seal. You will load up the bearing race and the bearing will become hard to turn.**

The only thing that you may wish to do to these bearing is to clean them well with a good degreaser or gasoline, and then spray paint them with several coats of cold galvanizing paint. This will keep surface rust from forming. You may touch them up once a year.

Thank you for your purchase of this lifetime Bearing.
